

Biohazardous waste management for hospitals

Hospitals will no longer have to pay for waste disposal.

Saving on disposal costs is not the only way of increasing profitability, our state of the art methodology produces new values.

Hospitals produce an average of 4 kg of waste per bed on daily bases. Waste handling is cost intensive. In the best case disposal companies incinerate it.

We offer our patented Energy Recovery System. Hospitals will get rid of waste handling costs for good by implementing our system.

The environmental impact is very high

Incineration emits huge amount of carcinogenic dioxin, lavishing 75% of contained energy. Slag, remaining after the process, is highly poisonous.

Advantages of our solution

No poisonous material is generated. Approx 90% of the input waste is turned back to energy, and the remaining material is environmentally neutral.

Our Energy Recovery System is a patented innovation which is capable to clean the environment in a sustainable way, turning waste into money and more. Leard more: https://youtu.be/VVWqKT4_OsE
